Revolutionary Atomic Model

(Framework For A Grand Unified Theory)

Secrets Of Nuclear & Atomic Structure Deciphered ~Ancient Mysteries Solved~

Possibly the biggest development in atomic and nuclear theory in over 200 years, the **Lattice Nested Hydreno** model takes science to the next level of fundamental understanding, explaining many of the greatest mysteries of the Universe in truly astounding detail.

Contrary to the assertions of **Bohr** and **Rutherford**, it is intuitively obvious that the structure and geometry of the nucleus must have a direct bearing on the properties of the atom as clearly evident in this radically new atomic model.

For the **first time in history**, the hidden **geometric code** of the Periodic Table of Elements, including their Isotopes and Allotropes, is deciphered in a logical, common sense fashion accounting for literally thousands of previously unexplained chemical and nuclear properties and phenomena including:

- The relationship between nuclear, atomic and macroscopic reality.
- Isotopic distribution, abundance, missing isotopes & elements (Tc).
- The void of stability from Bi to Th & the upper limit of nuclear diameter.
- What causes the escalating neutron-proton ratio.
- Why U235 is thermal neutron fissionable, while U238 is not.
- The difference between thermonuclear and "cold" nuclear reactions.
- The strong force, nuclear geometry, nucleon structure, spin quanta.
- Atomic and nuclear based allotropes, isomers & crystal structure.
- Electron structure, orbital shells, orbital shapes and quantization.

Was Bohr Wrong?

Bohr's assertion that the nucleus has no impact on the chemistry of the atom, and that point particle electrons orbit the nucleus in planetary fashion is evidently quite wrong.

The radically different view proposed in the Hydreno atomic model clearly proves that the chemistry of the atom is directly attributable to the definitive geometric lattice of the nucleus and its extrapolation to the atomic dimension through the electron "orbitals".
