

Dear Reader,

With China's government and workers driving the shift toward sustainable business practices, what does the future hold for the rising economy? That is the question that led Wayne Visser explore for readers of the blog **Talkback**, produced by the *Corporate Social Responsibility Newswire*. His post, which we share here with permission, is part of the series *Searching for Sustainable Business*.

Enjoy the reading!

## Stop and Reflect

Issue # 154

June 2013

### **Yin and Yang Striving for Sustainable Harmony in China** By Dr. Wayne Visser

I first visited China in 2008, where I presented at the China Europe International Business School (CEIBS) conference on Responsible Competitiveness, in Shanghai. I was also a judge for the Innovate China International MBA competition. My initial impressions were that – contrary to popular belief – in the medium to long term, China may very well set an example for other countries and companies in terms of sustainability and responsibility.

A clue to my optimism came from something that William Valentino, CSR Director for Bayer in China, said to me:

*“Above all else, China prizes stability. And stability, in turn, can only be maintained under conditions of social upliftment and environmental improvement.”*

Despite labor conditions remaining a concern, human rights abuses are starting to become the exception rather than the rule, and I believe China's sustained economic boom is doing far more social good than harm.

## Growth Hits Up Against Environmental Constraints

Reconciling its new-found addiction to growth with environmental constraints, however, may prove its most difficult challenge yet. Elizabeth Economy, author of *The River Runs Black*, has studied China's environmental challenges in depth and believes the crisis they face is deep and intractable.

The facts she cited when I interviewed her for *The Top 50 Sustainability Books*, were sobering, to say the least. She told me China has 20 of the world's 30 most polluted cities in terms of air quality. Seven hundred and fifty thousand people die prematurely every year in China because of respiratory diseases related to air pollution.

Water is another major challenge. China has only 25 percent of the world's average per capita availability of water. Something like almost 30 percent of the water that runs through China's seven major river systems and tributaries is unfit even for agriculture or industry, much less any form of drinking or fishing. Between five and 10 cities will completely run out of water by 2050.

China is roughly one-quarter desert, and the desert is advancing somewhere between 1,300 and 1,900 square miles per year. Furthermore, 10 percent of China's agricultural land is contaminated with heavy metals and other contaminants.

## Signs for Optimism In China's Green Industry

People like Amory Lovins, founder of the Rocky Mountain Institute, is more optimistic. He told me that China is the only country that's cut its energy intensity over 5 percent a year for a quarter of a century. They are the world leader in distributed renewable sources of power and the only country that has energy efficiency as its top development priority.

To be sure, implementation is at an early stage. But, Lovins said, China has better leaders than we do, and they are more highly motivated and work harder.

*"For all these reasons, I think we can rely on China to lead the world out of the climate mess."*

William McDonough, co-author of *Cradle to Cradle*, shares these sentiments. He told me that while "they're not going to become an eco-paradise overnight, at the senior level, they've recognised the idea of closing cycles as being a critical part of any long-term

plan." The only difference is that they

call it the "circular

economy,” rather than C2C. McDonough believes this will be driven by necessity rather than virtue.

### Sustainable Business in China: Shifting Motivations

I returned to China in June 2010 as part of my CSR quest world tour, to deliver a seminar at the Peking University campus in Beijing. I also gave a talk in Shanghai to the Women In Sustainability Action (WISA) group.

It was interesting to observe how things had changed in the two years since I had last visited. As my Chinese colleagues kept reminding me, in China two years is a long time. Despite being awash with CSR conferences and the rapid uptake of sustainability reporting, most large companies were, as far as I could tell, still stuck in a philanthropic, project-based mode of CSR.

However, the drivers for sustainable business seemed to have shifted. Whereas before, Western pressure mainly drove the process through the supply chain, now the two main advocates seem to be the Chinese government and the workers themselves.

### Market Opportunities For Sustainability

Apart from CSR management, China is investing heavily in the market opportunities provided by sustainable business issues, especially clean technology. This explosive growth was brought home to me when, at the WISA event where I was speaking, I got talking to a supplier of wind turbines to Europe. His chief complaint was that he couldn't keep up with the demand. He was turning customers away because there was already 12 months of orders in the pipeline.

There are many other positive signs.

China's decision to subsidize the factory expansions of its solar companies has helped cut the cost of panels in half since 2010. According to the 2012 Ernst & Young ranking of country attractiveness for renewable energy investments, China leads the world, ahead of the U.S. and Germany.

China - the world's biggest carbon emitter – is now piloting carbon trading schemes, which may lead to a national Chinese emissions trading scheme in 2015, and even a cap for 2016-2020. China's fish farming, which accounts for 62 percent of the world's aquaculture, has a lower ecological footprint than production in the West.

And China aims to develop one billion square metres of new green building floor area by 2015, a fourteen-fold increase on 2012.

### Social & Environmental Entrepreneurship: A Rising Trend

We are also increasingly seeing social and environmental entrepreneurship coming out of China, like the inspiring story of Wang Chuanfu, founder of BYD, which is today one of the biggest manufacturers of electric cars.

Another is Zhang Yin, the founder and director of Nine Dragons Paper, a recycling company that buys scrap paper from the U.S., imports it into China, and turns it mainly into cardboard for use in boxes to export Chinese goods. In 2006, she topped the list of the richest people in China and by 2010 her \$4.6 billion fortune placed her ahead of the likes of Oprah Winfrey and JK Rowling.

Based on all these trends, I believe that if China can continue to evolve a more holistic understanding of sustainable business – beyond philanthropic CSR and built on the platform of the government’s policy of “harmonious society” – China may continue to surprise the West.
